

Thoughts

This project is a very big one in scope. It requires a lot of main parts but it would play out extremely well in the long right.

Since it's big in scope I want to break it into chunks first

AI assistant

the blue tooth is
definitely a later phase

Base AI → AI classes

Bluetooth connect to
glasses which connect to
phone which connect to
server

No need to worry
about the glasses
for now: just need
to keep in mind maybe
a platform state to change it

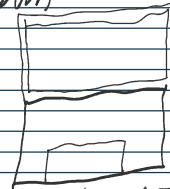

so this means that right now
a few base features are

- shortcut to option either a request
or image prompt

- sends the request to server &
so overall
memory can be done later

so this leaves the
AI

let's break it down

tasks, APPs
are remembered
it picks up habits & recommends
them

shortcut creates an immediate
GUI for a request → response

constant screen capture should
be necessary

security risk

but for time being
I won't worry about

Phase 1
• MVP
• Memory

Phase 2
• Brain
• Cluster workers
• Server cluster

Phase 3
• classes development
• Phone compatibility

Phase 1

So I don't expect to work
a lot with AI this phase
mainly I will implement the
base structure.

- screen capture
- image & text input into AI
- memory management

Act, I pretty will work a lot
w/ AI optimization so it's pretty
fine.
